SKOLNIK - Radar is a detection system that uses radio waves to determine the range, angle, or velocity of objects. It can be used to detect aircraft, ships, spacecraft, guided missiles, motor vehicles, weather formations, and terrain. A larger RCS indicates that an object is more easily detected. An object reflects a limited amount of radar energy back to the source.

As it was originally conceived, radio waves were used to detect the presence of a target and to determine its distance or range. The reflection of radio waves by objects was first noted more than a century ago. In 1903, the reflection of radio Thu, 06 Dec 2018 00:09:00 GMT Radar Fundamentals (Part I) Aircraft 101 - Over its long production history a wide range of radar types and subtypes have been fitted to variants of the Sukhoi Flanker fighter. Whilst some observers like to generalise the term 'Flanker radar' it is not unlike saying 'Pentium PC' - the range of power aperture product performance seen across these radars is greater than in any other tier ...
